Wikipedia: Probability interpretation. Probability is simply the chance of something happening. We can't know for sure what will happen, but we can estimate the probability of different outcomes. For example, if you flip a coin, the probability of heads is 50%. In statistics, we use probability to make predictions and understand the world around us. It's a fundamental concept in many fields, from science to economics. The probability of an event occurring is a number between 0 and 1, where 0 means it will never happen and 1 means it will always happen. We can use probability to calculate the odds of winning a game, the chance of getting sick, or the likelihood of a stock price rising. It's a powerful tool for understanding uncertainty and making informed decisions.
